

SMART EVENT MANAGEMENT & ANALYTICS SYSTEM

ABSTRACT

The Smart Event Management & Analytics System is a database-driven application developed using MySQL to manage and automate various event-related activities within an educational institution. The system provides facilities for organizing events, managing attendees, handling registrations, processing payments, tracking attendance, generating certificates, collecting feedback, and analyzing event performance.

The primary objective of this project is to replace manual event management processes with an efficient relational database system. The project utilizes normalization, primary keys, foreign keys, triggers, stored procedures, views, and analytical queries to ensure data integrity and improve reporting capabilities.

The system supports multiple stakeholders including organizers, faculty coordinators, attendees, sponsors, and volunteers. Advanced reporting features enable administrators to evaluate participation trends, attendance rates, revenue generation, and feedback ratings.

The project demonstrates the practical application of Database Management System concepts in solving real-world organizational problems and improving operational efficiency.
